Should we measure and report AI generated content ?

I think so, yes

How do we measure and report AI generated content ?

These are some suggestions

AI generated source code

I treat using AI to write code as an experiment

I want to measure how much I use it, and what results it generates

All of the source code in my project modified by AI contains a log in the header

```
AIMetrics: [  
  {  
    "timestamp": "2026-04-13T12:00:00",  
    "name": "Cursor CLI",  
    "version": "2026.02.13-41ac335",  
    "model": "Claude 4.6 Opus (Thinking)",  
    "contribution": {  
      "value": 10,  
      "units": "%"  
    }  
  }  
]
```

AI generated source code

I don't write the log entries

I have a rule that tells AI agents to write the log entries for me

Every file you create or modify must have an AIMetrics block in its file header comment.

- If a file already has an AIMetrics block, update it by adding a new entry to the array (do not remove existing entries).
- If a file has no AIMetrics block, add one.
- For new files created entirely by the agent, set contribution value to 100.
- For modified files, estimate the percentage of lines changed and use that as the contribution value.

Result is a log of all the changes that AI agents have contributed to my projects.

Minimal cost to collect, might be useful to look back on.

AI prompts and responses

I already keep verbatim notes of my work.

Adding the prompts and (truncated) responses has become part of the process

? Prompts written by me are tagged by a '?' on the left.

- > Results generated by the AI are tagged by a '>'.
- > I normally skip the thinking aloud parts
- > and just log the end result of each step

Result is a log of all the prompts that I have used and the results that they have generated.

Costs a lot to collect, only useful for geeks .

Emails

As a courtesy to colleagues, my email footer has an AIMetrics block that declares how much of the email was generated by AI.

Dave Morris
Research Software Engineer

University of Manchester

AIMetrics: []

Personally, I don't use AI to write emails, so it is always empty.

If/when I do use AI to write emails, I will update the AIMetrics to declare it.

Minimal cost, only useful for geeks .

IVOA Standards and documents

Should we measure and report AI generated content in our documents ?

I think so, yes

How do we measure and report AI generated content ?

Git commit logs

Document change logs

LaTeX comments

Do small edits count differently to writing whole sections

GitHub issues

Should we measure and report AI generated issues ?

I think so, yes

How do we measure and report AI generated issues ?

Separate GitHub identity

Text comments

AIMetrics

Do small edits count differently to writing whole issues

How much time do we want to spend chasing AI generated slop ?

Thank you
